

Welcome to Experiment 3!

This is the final and main experiment.

In this experiment we will combine the skills you have learned from the previous two experiments. You will be required to make an eye movement to a target and to make a decision about which target flickered first.

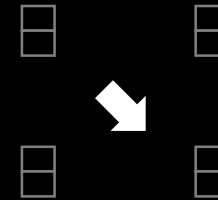

Here is the procedure:

1.

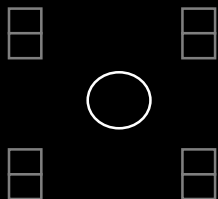

You will start once again by fixating on the central cross

2.

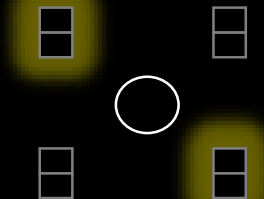

An arrow will appear that will instruct you to “prepare” an eye movement to one of the “8”s

3.

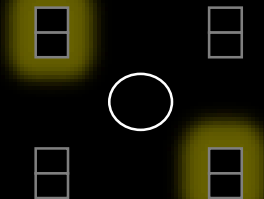

A circle will then appear which is the GO signal, make your eye movement now as quickly as possible to the target.

4.

During this time, two of the “8”s will glow bright. Make a decision about which “8” flickered on first based on the arrow keys and the side that flickered first.

5.

Every block, the experiment will reverse! In all odd blocks (1,3,5), you will be asked to judge which target appeared **FIRST**. In all even blocks (2,4,6), you will be asked to judge which target appeared **SECOND**.
